

The Food Chain of the Snow Leopard

The food chain of the snow leopard begins with the sun as an **energy source** helping the grass and plants on the Himalayan mountains to grow. The grass grows and **produces** food for the mountain goats and bharals which live in the mountains. As they **consume** the grass, their **predator**, snow leopard hunts them and kills them as **prey** and **consumes** them with his family. He is at the top of the food chain.
